

CodeFirst Lab

Use Code-First to create an app with the following screens. Populate the database with your **own list** of genres, ratings, and movies by using the application. NOTE: If you want to have an Action/Adventure genre, be sure not to have a slash in the name. That will cause problems with the application eventually. As you see below, I have called it Action_Adventure.

Assume each movie has only ONE genre and one rating.

Match all headings, links, and screen formats exactly except for the actual names, genres, and rating of the movies.

Since ASP.NET MVC applications are very big, I won't have you submit your application. Instead, I would like you to create a video where you show me what happens when you run your application. **See instructions below for creating your video.**
